THERMO HEMP COMBIJUTE

The insulation made from hemp and jute fibres

Description:

- Building authority approved insulation
- Flexible insulation matts made from durable robust hemp fibres and upcycled jute fibres from food bags
- Second life cycle of natural fibres instead of thermal recycling
- Thermo bonding process of manufacturing uses 100% renewable energy

Properties:

- Best thermal insulation due to a low thermal conductivity
- Excellent heat protection in summer due to high heat storage capacity
- Very good soundproofing properties
- Recommended tools:
- HempFlax insulation saw
- Bosch "Alligator" GFZ with serrated blade
- o Festool insulation saw with serrated blade
- Humidity regulating due to high moisture absorption capacity
- Contains no nutrients for rodents and insects

Applications:

- Insulation between rafters, wooden beams/joists and cavities of appropriate constructions (DZ)
- Interior insulation of ceilings or roofs, under the supporting structure (rafters) and within suspended ceilings (DI)
- Loft insulation (accessible top floor ceilings)
- Cavity insulation of exterior and interior walls in timber frame construction and similar constructions (WH, WTR)
- Internal insulation of external walls between a supporting structure (WI)

General Information

- Storage, preparation and installation must be in dry conditions. Store upright
- To achieve an installation with no gaps, install oversized by 10-20mm on each side
- When installed slightly oversized, the insulation is compressed and pushes against the sides of the joists. In general, this "friction fit" will hold the insulation in place prior to installing the vapour barrier or mechanical fixings. The ability for the insulation to stay in place with the compression force alone is dependent on the insulation thickness, rafter spacing, surface friction and roof slope. If the combination of these parameters is unfavourable, matts can be stapled to the rafters at the edges to temporarily hold them in place.
- After installation the insulation must be immediately covered with a vapour barrier
- The insulation material and vapour barrier must be permanently secured with battens
- The properties and performance of the insulation can only be achieved if the product is installed
 according to the guidelines of the manufacturer and if it is protected from rain and moisture
 during storage, transport and installation
- The application of national building regulations must always be observed!
